

TARGET-STATE HIGH-LEVEL ARCHITECTURE

Enterprise AI control plane, execution substrate, knowledge/context plane, governed interoperability, inference and production operations.

ARCHITECTURE CONTROL POINTS

- The architecture separates control intent from runtime execution; registries and policy constrain what the runtime may execute.
- Context is an explicit boundary; retrieval and memory are filtered, provenance-aware and budgeted before inference.
- Tool and agent delegation are capability boundaries; enterprise credentials do not reside in model context.
- Event-driven work is partitioned and replayable; workflow state remains durable and independently recoverable.
