

MODEL GATEWAY — ROUTING, HEALTH, POLICY & ECONOMICS

Application capabilities are decoupled from provider APIs; route selection is deterministic even when model behavior is probabilistic.

ARCHITECTURE CONTROL POINTS

- A model timeout is not automatically retryable; side effects are governed separately.
- If no approved route satisfies policy and SLO constraints, the system fails explicitly rather than silently selecting an ungoverned model.
- Routing, provider health, token usage and cache state feed operational and FinOps telemetry.
