

SCALABILITY TARGET vs PRODUCTION EVIDENCE

Separates architectural capability/target from measured production validation to prevent over-claiming.

ARCHITECTURE CONTROL POINTS

- The supplied material contains more than one measurement set; this diagram intentionally does not combine incompatible baselines.
- 8,500+ concurrent AI sessions, 99.97% availability and P95 3.4s→870ms are shown as reported evidence in the source material.
- Any larger scalability target should be presented as architecture capability/target until independently validated.
